SUMMARY

Software product engineer with 5 years of experience shipping production web and mobile products, currently at Zero One Group and previously building AI-assisted document generation and offline-first field applications for MapTrack. Comfortable owning a feature from data model to interface: Next.js and TypeScript on the front, Supabase, Laravel and DynamoDB behind it, with OpenAI and retrieval-augmented generation where it earns its place.

EXPERIENCE

Software Product Engineer

Zero One Group, Full-time

Jun 2026 – Present

Angular, React.js, React Native, TypeScript

- Remediated security findings across several Sampoerna applications running on different stacks, including Angular, React.js and React Native, adapting the fix to each codebase rather than forcing one shared pattern.
- Worked alongside QA on the Sampoerna engagement, writing Gherkin scenarios and collecting test evidence so every fix was verified and auditable instead of merged on trust.
- Own the Teazzi back office as frontend engineer, covering order management, customer records, voucher creation and refund handling for the operations team.
- Build customer-facing flows in the Teazzi user app, from placing an order through payment to live order status tracking.
- Review teammates' pull requests to keep frontend conventions consistent as the codebase grows.

Software Product Engineer

MapTrack, Remote, Freelance

Oct 2024 – May 2026

Next.js, TypeScript, Supabase, OpenAI

- Built an OpenAI-powered PDF generation system that turns custom form definitions into structured, print-ready reports, replacing a manual preparation step for field teams.
- Rebuilt the data layer on TanStack DB so the app works offline first, letting field crews keep recording in low-signal areas and syncing automatically once connectivity returns.
- Shipped GPS battery monitoring and device status indicators on Amazon DynamoDB, chosen for high-frequency telemetry writes, so operations can spot a failing tracker before it affects a job.
- Designed an interactive asset map with marker collision handling, layered filters and a detail drawer, so dispatchers locate and inspect a vehicle from the map itself instead of cross-referencing tables.

Frontend Web and Mobile Engineer

Happy5, Remote, Full-time

Mar 2021 – Dec 2025

React.js, React Native, TypeScript, Tailwind CSS

- Led frontend code reviews and mentored intern engineers, setting the review conventions and onboarding path for people new to the codebase.
- Migrated legacy JavaScript modules to TypeScript incrementally rather than in one sweep, so type safety landed across the product without pausing feature delivery.
- Built and documented a reusable component library in Storybook, giving design and engineering a single source of truth for shared UI.
- Introduced end-to-end testing with Cypress across the critical HR flows, moving regression detection from production reports into CI.
- Shipped the Happy5 Culture mobile app in React Native with Tailwind CSS, holding one design system across iOS and Android from a single codebase.
- Owned the Amplitude analytics integration, instrumenting feature events so product decisions were argued from usage data rather than assumption.
- Translated Figma designs into pixel-accurate, responsive interfaces in React.js and Tailwind CSS.

Frontend Web Engineer, Intern

Happy5, Remote, Internship

May 2020 – Mar 2021

React.js, Cypress, @react-pdf/renderer

- Built PDF export for formal performance review results with @react-pdf/renderer, removing a manual copy-and-format step from every review cycle.
- Wrote end-to-end tests with Cypress and fixed bugs ahead of release. Converted to a full-time frontend role at the end of the internship.

Frontend Web Engineer

Kodegiri, Remote, Freelance

Mar 2024 – Jun 2024

React.js, Ant Design, Tailwind CSS, TypeScript

- Revamped the VRMS web application with a modernised UI and an expanded feature set on React.js, Ant Design and Tailwind CSS.
- Migrated the codebase to TypeScript, pushing an entire class of runtime errors forward into build time instead of QA.

Frontend Web Engineer

Rakamin Academy, Remote, Freelance

Mar 2022 – Apr 2022

React.js, React Query, Styled Components

- Built production React components straight from design handoff, integrating backend services through React Query for cached, deduplicated data fetching.
- Themed the application with Styled Components to keep styling consistent and maintainable across pages.

ITHO Indostock, Remote, Freelance

Jul 2021 – Feb 2022

Next.js, React.js

- Rebuilt legacy pages in Next.js and shipped new features, bringing the platform in line with current performance and UX expectations.
- Created shared API utility functions adopted across the codebase to stop request handling being reimplemented page by page.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, PHP, SQL

Frontend: React.js, Next.js, React Native, Angular, Ionic Capacitor, Tailwind CSS, Shadcn UI, Ant Design, Styled Components, React Hook Form, Zod

Backend and Data: Laravel, Inertia.js, Supabase, PostgreSQL, SQLite, Amazon DynamoDB

AI: OpenAI API, Mistral AI, Retrieval-Augmented Generation (RAG), vector search

State and Data Management: TanStack Query, TanStack DB, Redux

Testing and Tooling: Cypress, Gherkin, Storybook, Git, Figma, Amplitude

SELECTED PROJECTS

Shopbot Assistant | Next.js, Supabase, OpenAI, WhatsApp Cloud API

AI shopping assistant on WhatsApp for small e-commerce sellers. Retrieval-augmented generation over Supabase vector search grounds every reply in the shop's own catalogue, so product recommendations and support answers stay accurate as the catalogue changes.

Expense Tracker | Laravel, Inertia.js, React.js, SQLite, Shadcn UI

Personal finance app with spending categorisation and visual breakdowns. Server-driven UI through Inertia.js gives SPA responsiveness without maintaining a separate API layer.

Stoqu Inamawangi | Go, React.js, Next.js

Inventory and order management system handling real-time stock movement and customer order processing, with a Go backend chosen for concurrent write throughput.

EDUCATION

Bachelor of Computer Science

Binus Online Learning, Indonesia

2022 – 2026

GPA 3.69 / 4.00

Network Informatics Systems and Applications

Vocational High School 26 Jakarta, Indonesia

2017 – 2021
